

Chapter 11: APA Report Writing

Communicating Your Research

Gordon Wright

1 Overview

What This Chapter Covers

This chapter explains the structure of an APA-style lab report, how to write a Method section (using your Research Plan as a worked example), and the writing conventions you'll need for academic psychology writing.

- The sections of an APA lab report and what goes in each
- How to write a Method section (the same structure as your Research Plan)
- APA writing conventions (tense, person, statistical notation)
- Common mistakes and how to avoid them

This chapter is your reference guide for writing in psychology. You'll come back to it repeatedly over the coming weeks as you write your Research Report.

2 The APA Lab Report

Psychology uses a standardised format for reporting research — the APA (American Psychological Association) style. Every lab report follows the same structure, which means readers always know where to find the information they need.

Your Research Report (due 1 May, 2,500 words) will follow this format exactly.

2.1 The Seven Sections

Section	Purpose	Approximate proportion
Title Page	Identifies the study, author, and institution	—
Abstract	~150-word summary of the entire study	~5%

Section	Purpose	Approximate proportion
Introduction	Background literature, rationale, and hypothesis	~25-30%
Method	What you did — design, participants, materials, procedure	~25-30%
Results	What you found — descriptive and inferential statistics	~15-20%
Discussion	What it means — interpretation, limitations, future directions	~20-25%
References	Full APA-format- ed reference list	—

2.2 The Hourglass Shape

APA reports follow an hourglass shape:

- **Introduction** moves from broad to narrow — starting with the general topic, reviewing specific research, and ending with your hypothesis
- **Method and Results** are the narrow middle — precise, detailed, specific
- **Discussion** moves from narrow to broad — starting with your findings, interpreting them, and ending with wider implications

This shape means you tell a story: here's what we know, here's what we did, here's what we found, and here's what it means.

3 Section by Section

3.1 Title Page

Your title should be concise and informative. It should include your key variables.

Good title: "The Effect of Word Concreteness on Free Recall Performance"

Poor title: "My Psychology Experiment" or "Memory Study"

Include your name, student number, and the module code (PS50008A).

3.2 Abstract

The abstract is a brief summary of the entire study, typically around 150 words. It should cover:

1. One or two sentences of **background and rationale**
2. One sentence on **method** (design, participants, key task)
3. One or two sentences on **key results** (with statistics)
4. One sentence on **conclusion and implications**

When to Write the Abstract

Write the abstract **last** — after every other section is complete. It's a summary, not a preview. You can't summarise something you haven't written yet.

3.3 Introduction

The Introduction builds a logical argument from existing literature to your specific research question. Think of it as a funnel:

1. **General topic area** — What is the broad field? (e.g., memory research)
2. **Key research findings** — What have other researchers found? (cite specific studies)
3. **Gap or question** — What hasn't been addressed or needs further investigation?
4. **Your study** — What are you investigating and why?
5. **Hypothesis** — Your specific, testable prediction

Common mistakes in Introductions:

- Starting with a dictionary definition ("The Oxford Dictionary defines memory as...")
- Listing studies without connecting them ("Smith found X. Jones found Y. Brown found Z.")
- Including your results
- Making claims without citing evidence

3.4 Method

The Method section describes what you did in enough detail that another researcher could replicate your study. It has four standard subsections.

Your Research Plan Practises Method Writing

The Research Plan you're submitting this week is a **standalone assessment** on its own topic. But it's structured exactly like a Method section — the same four subsections you'll use when you write the Method for your Research Report (which is on a different topic, based on your group project).

3.4.a Design

State your experimental design and justify it. Include:

- Type of design (between-subjects or within-subjects)
- Independent variable and its levels
- Dependent variable and how it's measured

Weak: “We used a between-subjects design.”

Strong: “A between-subjects design was used. The independent variable was word type with two levels: concrete words and abstract words. The dependent variable was the number of words correctly recalled out of 15. A between-subjects design was chosen to avoid practice and fatigue effects that could confound recall performance.”

Notice the strong version includes **justification** — it explains *why* this design was chosen, not just *what* it is.

3.4.b Participants

Describe who took part and how they were recruited:

- Total number of participants (and per condition if between-subjects)
- Recruitment method (e.g., opportunity sampling)
- Key demographics (age range, mean age, gender breakdown)
- Any inclusion or exclusion criteria

Good example: “Twenty participants (15 female, 5 male; $M_{\text{age}} = 21.3$, $SD = 2.1$) were recruited via opportunity sampling from the student population at Goldsmiths, University of London. All were native English speakers aged 18 or over. Ten participants were randomly allocated to each condition.”

3.4.c Materials

Describe everything you used to run the study:

- Stimuli (word lists, images, questionnaires — with examples)
- How materials were created or sourced
- Key properties (e.g., word frequency, number of items)
- Equipment (if relevant)

Good example: “Two word lists were constructed, each containing 15 words. The concrete list contained words referring to physical objects (e.g., *hammer*, *bicycle*, *elephant*). The abstract list contained words referring to concepts or qualities (e.g., *freedom*, *honesty*, *courage*). Lists were matched for word frequency and syllable count using the MRC Psycholinguistic Database.”

3.4.d Procedure

Describe what happened, step by step, in chronological order:

- What participants experienced from start to finish
- Timing of each phase
- Standardised instructions (summarised, not verbatim)
- Ethical safeguards — informed consent and debriefing

Good example: “Participants were tested individually in a quiet room. After providing written informed consent, they were presented with their assigned word list displayed on a computer screen and given two minutes to study the words. The list was then removed and participants counted backwards from 100 for one minute as a distractor task. They were then given two minutes to write down as many words as they could recall, in any order. Finally, participants were fully debriefed about the purpose of the study and thanked for their participation.”

Common mistakes in Method sections:

- Too vague — “Participants did a memory test” (What kind? How long? How scored?)
- Including results — Method describes what you *did*, not what you *found*
- Missing justification — State your design AND explain *why*
- Wrong tense — Method uses **past tense**
- Forgetting ethics — Always mention consent and debriefing

3.5 Results

The Results section reports what you found using both descriptive and inferential statistics. A standard results paragraph for a t-test includes:

1. **Descriptive statistics** — means and standard deviations for each condition
2. **Inferential test** — the t-test result with full APA notation
3. **Effect size** — Cohen’s *d* with 95% confidence interval
4. **Brief interpretation** — what the numbers mean in words

Complete results paragraph: “Participants in the concrete word condition recalled significantly more words ($M = 11.2$, $SD = 2.4$) than those in the abstract word condition ($M = 8.7$, $SD = 2.1$). An independent-samples t-test confirmed this difference was statistically significant, $t(18) = 2.48$, $p = .023$, $d = 1.11$, 95% CI [0.17, 2.03]. This represents a large effect, suggesting that word concreteness has a substantial influence on free recall performance.”

We’ll cover Results reporting in full detail in the Week 19 lecture reading.

3.6 Discussion

The Discussion interprets your findings and places them in context:

1. **Restate key findings** (in words, not statistics)
2. **Interpret** — what do the results mean? Were your hypotheses supported?
3. **Relate to literature** — do your findings support or contradict previous research?
4. **Limitations** — what could have affected the results? What would you do differently?
5. **Future directions** — what should researchers investigate next?
6. **Conclusion** — a brief take-home message

We’ll cover Discussion writing in the Week 20 lecture reading.

3.7 References

Every source you cite in-text must appear in the reference list, and vice versa. Use APA 7th edition format.

Journal article format:

Walker, I., & Hulme, C. (1999). Concrete words are easier to recall than abstract words: Evidence for a semantic contribution to short-term serial recall. *Journal of Experimental Psychology: Learning, Memory, and Cognition*, 25(5), 1256–1271. <https://doi.org/10.1037/0278-7393.25.5.1256>

Use a Reference Manager

Zotero (free) or Mendeley (free) will format your references automatically and save you hours of manual formatting. Install one now if you haven't already.

4 APA Writing Conventions

4.1 Tense

Section		Tense	Example
Introduction (established findings)		Present	"Research <i>suggests</i> that..."
Introduction (specific studies)	past	Past	"Walker and Hulme (1999) <i>found</i> that..."
Method		Past	"Participants <i>were</i> randomly allocated..."
Results		Past	"The difference <i>was</i> statistically significant..."
Discussion (your findings)		Past	"The results <i>showed</i> that..."
Discussion (implications)		Present	"These findings <i>suggest</i> that..."

4.2 Person and Voice

- **Third person** is preferred throughout
 - "Participants were asked to..." (not "I asked participants to...")
 - "The study aimed to..." (not "We aimed to...")
- **Passive voice** is acceptable in Method and Results
 - "Words were presented for two minutes"
- **Active voice** for describing others' research

- “Walker and Hulme (1999) demonstrated that...”

4.3 Statistical Notation

Key rules:

- **Italicise** all statistical symbols: t , F , r , p , M , SD , d , n , N
- **No leading zero** for statistics bounded by ± 1 : $p = .023$, $r = .72$
- **Leading zero** for statistics that can exceed ± 1 : $M = 0.45$
- **Exact p-values** to three decimal places: $p = .023$ (not $p < .05$)
- **Exception**: when $p < .001$, report as $p < .001$ (never $p = .000$)

APA t-test format: $t(18) = 2.48$, $p = .023$, $d = 1.11$, 95% CI [0.17 , 2.03]

5 Two Assessments, Two Studies

! Important

Your **Research Plan** (due this Friday) and your **Research Report** (due 1 May) are about **different topics**.

- The Research Plan is on the topic you chose (font difficulty, hydration, or eye contact)
- The Research Report is based on your **group project** (a different study you'll design and run together)

The Research Plan practises the same skills — hypothesis, design, participants, materials, procedure — that you'll use again when writing the Method section of your Research Report. Think of it as a rehearsal.

6 Key Terms

APA format — The standardised style for writing and formatting psychology research reports, set by the American Psychological Association.

Replication — The ability of another researcher to repeat a study using the same method. A good Method section enables replication.

Operationalisation — Defining a variable in terms of how it is measured. For example, “memory” operationalised as “number of words correctly recalled out of 15.”

Effect size — A standardised measure of the magnitude of a difference or relationship, independent of sample size. Cohen's d is used for comparing two means.

7 Summary

- APA lab reports follow a **standard seven-section structure**: Title, Abstract, Introduction, Method, Results, Discussion, References
- The report has an **hourglass shape** — broad to narrow to broad
- Your Research Plan **practises Method writing** — the same structure you'll use for your Research Report
- Use **past tense** for Method and Results, **present tense** for established findings
- **Italicise** statistical symbols; no leading zero for p and r
- **Justify** every decision — don't just say *what*, explain *why*
- The Research Report builds **week by week** from now
