Writing Lab Reports in APA Format

7th Edition Style Guide for Psychology Students

PS50008A · Research Methods & Experimental Design · Goldsmiths, University of London

made with  + 

1 Introduction to APA Style

1.1 What is APA Format?

APA (American Psychological Association) format is the standard writing style used in psychology and related disciplines. The 7th edition, published in 2019, is the current version you should follow.

APA style provides:

- A consistent structure for scientific communication
- Rules for formatting, citations, and references
- Guidelines for clear, unbiased language
- Standards for reporting statistical results

1.2 Why Does Formatting Matter?

Scientific writing follows strict conventions because:

1. **Clarity** - Readers know where to find specific information
2. **Credibility** - Professional presentation reflects scientific rigour
3. **Replicability** - Detailed methods allow others to repeat your study
4. **Efficiency** - Standard formats speed up reading and reviewing

2 Document Formatting

2.1 Basic Setup

Before you start writing, set up your document with these specifications:

Element	APA 7th Edition Requirement
Font	12-point Times New Roman, 11-point Calibri, or 11-point Arial
Spacing	Double-spaced throughout (including references)
Margins	2.54 cm (1 inch) on all sides
Alignment	Left-aligned (ragged right edge)
Paragraph indent	1.27 cm (0.5 inch) first line of each paragraph
Page numbers	Top right corner, starting from title page

2.2 Heading Levels

APA uses five levels of headings. For most lab reports, you'll use levels 1-3:

2.2.1 Level 1: Centred, Bold, Title Case

The heading is on its own line. Text begins as a new paragraph.

2.2.2 Level 2: Left-Aligned, Bold, Title Case

The heading is on its own line. Text begins as a new paragraph.

2.2.3 Level 3: Left-Aligned, Bold Italic, Title Case

The heading is on its own line. Text begins as a new paragraph.

Example structure:

Method	← Level 1
Design	← Level 2
Participants	← Level 2
Recruitment	← Level 3 (if needed)
Materials	← Level 2
Procedure	← Level 2

3 The Lab Report Structure

3.1 Overview

A standard lab report contains these sections in order:

1. Title Page
2. Abstract
3. Introduction
4. Method
5. Results
6. Discussion
7. References
8. Appendices (if needed)

Each major section (Introduction, Method, Results, Discussion) starts with a **Level 1 heading**.

Student Papers vs Professional Papers

APA 7th edition distinguishes between student papers and professional manuscripts. Your lab reports are **student papers**, which have slightly simplified requirements (e.g., no running head required unless your instructor specifies one).

4 Title Page

4.1 Required Elements

For student papers, the title page includes:

1. **Paper title** - Centred, bold, positioned in the upper half of the page
2. **Blank line**
3. **Your name**
4. **Department and institution** (e.g., Department of Psychology, Goldsmiths, University of London)
5. **Module code and name**
6. **Instructor name**
7. **Assignment due date**

4.2 Writing a Good Title

Your title should:

- Summarise the main topic and variables
- Be concise (aim for 12 words or fewer)
- Avoid unnecessary words like "A Study of..." or "An Investigation into..."

Weak titles:

- "Psychology Experiment" (*too vague*)
- "A Study Investigating the Effects of Caffeine on Memory" (*unnecessary words*)
- "Caffeine" (*too brief*)

Strong titles:

- "The Effect of Caffeine on Short-Term Memory for Words"
- "Background Music and Problem-Solving Performance"
- "Smartphone Notifications and Reading Comprehension in University Students"

4.3 Example Title Page

The Effect of Caffeine on Short-Term Memory for Words

33333333

Department of Psychology, Goldsmiths, University of London

PS50008A: Research Methods and Experimental Design

Dr Gordon Wright

28 February 2026

Good example: The title is specific and describes the key variables (caffeine, short-term memory). All required elements are present and centred. The title avoids filler phrases like "A Study of..." and gets straight to the point.

5 Abstract

5.1 Purpose

The abstract is a brief, comprehensive summary of your entire report. It allows readers to quickly determine whether the full paper is relevant to their interests.

5.2 Content (150-250 words)

Include one or two sentences on each of:

1. **Research question/objective** - What did you investigate?
2. **Method** - Key details (design, participants, procedure)
3. **Results** - Main findings with statistics
4. **Conclusions** - What do the results mean?

5.3 Formatting

- Appears on a new page after the title page
- "Abstract" centred, bold, at top of page
- Single paragraph, no indentation
- No citations (usually)

Key requirements: The abstract must be a single paragraph of 150-250 words with no indentation. It should cover your aim, method, key results (with statistics), and conclusion. Think of it as a miniature version of your entire report.

5.4 Example Abstract

Abstract

This study investigated whether caffeine consumption affects short-term memory performance. Forty university students (20 male, 20 female) aged 18-25 were randomly allocated to either a caffeine condition (200mg tablet) or a placebo condition. After a 30-minute absorption period, participants studied a list of 30 nouns and then completed a free recall task. An independent samples t-test revealed that participants in the caffeine condition recalled significantly more words ($M = 18.4$, $SD = 3.2$) than those in the placebo condition ($M = 15.1$, $SD = 2.9$), $t(38) = 3.42$, $p = .002$. These findings suggest that moderate caffeine consumption enhances short-term memory encoding, with potential implications for study habits in academic settings.

Good example: This abstract hits all four required elements: the research question (caffeine and memory), method (design, N, procedure), results (with means, SDs, and test statistics), and a brief conclusion. It stays within the word limit and uses a single unindented paragraph.

6 Introduction

6.1 Purpose

The Introduction provides context for your study. It moves from broad background to your specific research question, like an inverted triangle (funnel structure).

6.2 Structure

6.2.1 Opening: Establish the Topic

- Begin with the general area of research
- Why is this topic important or interesting?

6.2.2 Literature Review: What Do We Know?

- Summarise relevant previous research
- Identify gaps, inconsistencies, or unanswered questions
- Build the rationale for your study

6.2.3 Rationale: Why This Study?

- Explain what your study adds
- How does it address gaps in knowledge?

6.2.4 Hypotheses: What Do You Predict?

- State your predictions clearly
- Specify direction if making directional hypotheses
- End the Introduction with your hypotheses

6.3 Writing Tips

The "So What?" Test

After each paragraph, ask yourself: "So what? Why does this matter for my study?" If you can't answer, the paragraph may not be necessary.

Do:

- Use past tense for previous research ("Smith (2020) found that...")
- Build a logical argument leading to your hypothesis
- Be selective—only include relevant literature

Don't:

- Write a general essay about the topic

- Include every study ever conducted
- Save your hypothesis for the Method section

Key requirements: The Introduction should funnel from broad context to your specific hypothesis. Every paragraph should build the argument for why your study is needed. End with a clearly stated hypothesis that specifies the expected direction of the effect.

6.4 Example Introduction Excerpt

Memory is a fundamental cognitive process that underlies learning and academic performance (Baddeley, 2012). Understanding factors that influence memory has important practical implications, particularly in educational contexts where students seek ways to optimise their study habits.

Caffeine is the most widely consumed psychoactive substance worldwide, with university students frequently using caffeinated beverages during study periods (Mitchell et al., 2014). Research suggests that caffeine may enhance cognitive performance through its effects on alertness and attention. Smith et al. (2018) found that moderate caffeine doses (200mg) improved reaction times on attention tasks, while Jones and Williams (2019) demonstrated enhanced working memory performance following caffeine consumption.

However, findings regarding caffeine's effects on long-term memory encoding have been mixed. Some studies report benefits (Brown, 2017), while others find no significant effects (Taylor, 2020). These inconsistencies may reflect differences in dosage, timing of administration, or the specific memory tasks employed.

The present study aimed to investigate whether caffeine consumption enhances short-term memory for verbal material. Based on previous findings suggesting caffeine improves attention and working memory, it was hypothesised that participants who consumed caffeine would recall significantly more words than participants who did not consume caffeine (directional hypothesis).

Good example: Notice the clear funnel structure — it opens with the broad topic (memory), narrows to caffeine and cognition, identifies a gap (mixed findings), and ends with a specific directional hypothesis. Each paragraph logically builds on the last.

7 Method

7.1 Purpose

The Method section describes exactly what you did, providing sufficient detail for another researcher to replicate your study.

7.2 Subsections

The Method always includes these subsections (Level 2 headings):

1. **Design**
2. **Participants**
3. **Materials** (or Apparatus, or Stimuli)
4. **Procedure**

7.3 Design

State clearly:

- The type of experimental design
- The independent variable(s) and their levels
- The dependent variable(s) and how they were measured
- Any control variables

Key requirements: The Design section must name the design type, identify the IV with its levels, operationalise the DV, and mention key control variables. Keep it concise — this is usually one paragraph.

7.3.1 Example Design Section

Design

An independent groups design was employed. The independent variable was caffeine consumption with two levels: caffeine (200mg tablet) and placebo (identical lactose tablet). The dependent variable was memory performance, operationalised as the number of words correctly recalled from a list of 30 nouns (score range: 0-30). Participants were randomly allocated to conditions to control for individual differences in baseline memory ability.

Good example: All four elements are present: design type (independent groups), IV with levels (caffeine vs placebo), operationalised DV (number of words recalled, with score range), and a control measure (random allocation).

7.4 Participants

Include:

- Total number (N) and number per condition
- Demographics (age range, mean age, gender distribution)
- Recruitment method
- Any inclusion/exclusion criteria
- Compensation (if any)
- Ethical approval statement (if required)

7.4.1 Example Participants Section

Participants

Forty undergraduate students (20 male, 20 female) from Goldsmiths, University of London participated in the study. Participants were aged between 18 and 25 years ($M = 20.4$, $SD = 1.8$). They were recruited through the department's participant pool and received course credit for participation. Exclusion criteria included: caffeine sensitivity or related medical conditions, consumption of caffeine within 4 hours of testing, and non-native English speakers. The study received ethical approval from the Goldsmiths Psychology Ethics Committee.

Good example: This covers all the essentials: total N with gender breakdown, age range with mean and SD, recruitment method, compensation, specific exclusion criteria, and ethical approval. The exclusion criteria are well-justified and relevant to the study.

7.5 Materials

Describe all materials, equipment, and stimuli:

- Questionnaires or tests (include name, citation, reliability)
- Stimuli (with characteristics and how they were controlled)
- Equipment (computers, software, recording devices)

- Any physical materials (consent forms, response sheets)

7.5.1 Example Materials Section

Materials

Caffeine manipulation. The caffeine condition received 200mg caffeine tablets (Pro Plus), equivalent to approximately two cups of coffee. The placebo condition received identical-appearing lactose tablets. Both were administered with 250ml of water.

Word stimuli. The memory task comprised 30 concrete nouns (e.g., “table,” “apple,” “river”) selected from the MRC Psycholinguistic Database (Coltheart, 1981). All words were 4-6 letters in length, single or two syllables, and had a written frequency greater than 50 per million. Words were presented centrally on a computer screen in black 48-point Arial font on a white background using PsychoPy software (Peirce et al., 2019).

Additional materials. Participants completed a brief demographic questionnaire and a caffeine consumption habits questionnaire. Blank A4 paper was provided for the free recall task.

Good example: Materials are organised with clear italic sub-headings. Stimuli are described with specific characteristics (word length, frequency, font). Software is cited. The level of detail would allow another researcher to recreate the materials.

7.6 Procedure

Describe the sequence of events:

- Where testing occurred
- Step-by-step what happened
- Instructions given to participants
- Timing of each phase
- Mention consent and debriefing

Write in past tense, passive voice is acceptable.

7.6.1 Example Procedure Section

Procedure

Participants were tested individually in a quiet laboratory. Upon arrival, they read an information sheet and provided written informed consent. They then completed the demographic and caffeine habits questionnaires.

Participants were randomly assigned to either the caffeine or placebo condition using a computer-generated random number sequence. They consumed the allocated tablet with water and were not informed of their condition (single-blind). A 30-minute delay followed to allow for caffeine absorption; during this time, participants completed sudoku puzzles to prevent rehearsal of any material.

In the encoding phase, the 30 words were presented sequentially in a fixed random order. Each word appeared for 3 seconds, followed by a 1-second blank interval. Participants were instructed to “try to remember as many words as possible.”

Following encoding, participants completed a 2-minute distractor task (counting backwards from 100 in threes). In the recall phase, participants had 2 minutes to write down as many words as they could remember in any order.

Finally, participants were thanked and debriefed about the study’s purpose. They were offered the opportunity to withdraw their data and provided with researcher contact details for any follow-up questions.

Good example: The procedure reads like a clear timeline of events. It covers consent, the experimental manipulation, specific timings (3s per word, 30-min absorption), exact instructions given, and debriefing. A reader could replicate this study from this description.

8 Results

8.1 Purpose

The Results section presents your findings objectively, without interpretation. Save explanations of what the results *mean* for the Discussion.

8.2 Structure

1. **Restate the hypothesis** (briefly)

2. **Descriptive statistics** (means, standard deviations)
3. **Inferential statistics** (test results)
4. **State whether hypothesis was supported**

8.3 Reporting Descriptive Statistics

Always report:

- Mean (M)
- Standard deviation (SD)
- Sample size (N or n)

Format: $M = 18.40$, $SD = 3.21$ (or in parentheses within sentences)

! Decimal Places

Report means and SDs to **two decimal places**. Report exact p-values to **three decimal places** (unless $p < .001$, then write " $p < .001$ ").

8.4 Reporting Inferential Statistics

Each statistical test has a specific reporting format:

Key requirements: Every inferential test must include: the test name, descriptive statistics for each group, the test statistic with degrees of freedom, the exact p-value, and an effect size. Use italics for statistical symbols (M , SD , t , p , d , r).

8.4.1 t-Tests

Independent samples t-test:

An independent samples t-test revealed a significant difference between the caffeine group ($M = 18.40$, $SD = 3.21$) and the placebo group ($M = 15.10$, $SD = 2.87$), $t(38) = 3.42$, $p = .002$, $d = 1.08$.

Paired samples t-test:

A paired samples t-test revealed a significant difference between the congruent condition ($M = 542.30$, $SD = 48.21$) and the incongruent condition ($M = 623.50$, $SD = 52.14$), $t(29) = 8.91$, $p < .001$, $d = 1.62$.

8.4.2 Non-Parametric Tests

Mann-Whitney U:

A Mann-Whitney U test indicated that recall scores were significantly higher in the caffeine group ($Mdn = 18$) than in the placebo group ($Mdn = 15$), $U = 98.50$, $p = .003$.

Wilcoxon signed-rank:

A Wilcoxon signed-rank test indicated that reaction times were significantly lower in the congruent condition ($Mdn = 540$) than in the incongruent condition ($Mdn = 620$), $Z = -3.82$, $p < .001$.

8.4.3 Correlations

Pearson's r:

There was a significant positive correlation between hours of study and exam grade, $r(48) = .62$, $p < .001$.

Spearman's rho:

A Spearman's correlation revealed a significant positive relationship between perfectionism scores and stress symptoms, $r_s(38) = .54$, $p < .001$.

8.5 Effect Sizes

APA 7th edition recommends reporting effect sizes. Common measures:

Test	Effect Size	Small	Medium	Large
t-test	Cohen's d	0.2	0.5	0.8
Correlation	r	.10	.30	.50
Chi-square	Cramér's V	.10	.30	.50

8.6 Tables

Use tables to present complex data clearly.

APA table format:

- Table number (bold): Table 1
- Table title (italic): *Mean Recall Scores by Condition*
- No vertical lines
- Horizontal lines: above column headers, below column headers, below data
- Notes below table if needed

8.6.1 Example Table

Table 1

Mean Number of Words Recalled by Condition

Condition	n	M	SD
Caffeine	20	18.40	3.21
Placebo	20	15.10	2.87

Note. Maximum possible score = 30.

8.7 Figures

Figures include graphs, charts, images, and diagrams.

APA figure format:

- Figure number (bold): Figure 1
- Figure title (italic): *Mean recall scores by condition*
- Clearly labelled axes
- Error bars (usually ± 1 SE or 95% CI)
- Legend if needed
- Note below if needed

8.7.1 Example Figure Description

Figure 1 displays the mean number of words recalled in each condition. Error bars represent ± 1 standard error of the mean. The caffeine group recalled more words than the placebo group.

8.8 Example Results Section

Results

It was hypothesised that participants who consumed caffeine would recall significantly more words than those who consumed a placebo.

Descriptive statistics are presented in Table 1. Mean recall was higher in the caffeine condition ($M = 18.40$, $SD = 3.21$) compared to the placebo condition ($M = 15.10$, $SD = 2.87$).

Prior to analysis, Levene's test confirmed homogeneity of variance, $F(1, 38) = 0.34$, $p = .564$. An independent samples t-test revealed a significant difference in recall between conditions, $t(38) = 3.42$, $p = .002$, $d = 1.08$. Participants in the caffeine condition recalled significantly more words than those in the placebo condition.

These results support the experimental hypothesis.

Good example: This Results section follows the correct structure: restates the hypothesis, reports descriptive statistics, checks assumptions (Levene's test), presents the inferential test with all required components (test statistic, df, p-value, effect size), and states whether the hypothesis was supported. No interpretation is included — that belongs in the Discussion.

9 Discussion

9.1 Purpose

The Discussion interprets your findings, relates them to previous research, considers limitations, and suggests future directions.

9.2 Structure

1. **Summary of findings** - Restate main results (no statistics)
2. **Interpretation** - What do the results mean?
3. **Relation to previous research** - How do findings fit with the literature?
4. **Limitations** - What are the weaknesses of your study?
5. **Future directions** - What should be studied next?

9.3 Writing the Discussion

9.3.1 Summary of Findings

Start by restating your main finding in plain language:

The results supported the hypothesis that caffeine enhances short-term memory. Participants who consumed caffeine recalled significantly more words than those who consumed a placebo.

9.3.2 Interpretation

Explain what your findings mean:

These findings suggest that caffeine consumption improves the encoding of verbal material into short-term memory. This may occur through caffeine's stimulant effects on attention and arousal, enabling deeper processing of information during the study phase.

9.3.3 Relation to Previous Research

Connect your findings to the literature reviewed in your Introduction:

These results are consistent with Smith et al. (2018), who found that caffeine improved attention task performance, and extend these findings to memory encoding. However, our findings contrast with Taylor (2020), who reported no effect of caffeine on memory. This discrepancy may be explained by differences in timing: Taylor administered the memory task immediately after caffeine consumption, while the present study included a 30-minute absorption period.

Good example: This paragraph does two important things: it connects to supporting literature (Smith et al.) and addresses contradictory findings (Taylor) with a plausible explanation. This shows critical engagement with the literature rather than simply listing studies.

9.3.4 Limitations

Be honest about weaknesses, but don't be overly self-critical:

Several limitations should be considered. First, the sample comprised university students aged 18-25, limiting generalisability to other populations. Second, habitual caffeine consumers may have developed tolerance, potentially reducing the observed effects. Finally, the laboratory setting may not reflect real-world studying conditions.

 Avoid Generic Limitations

Don't write "the sample size was small" unless it actually was problematic. Focus on limitations specific to your study that might genuinely affect the conclusions.

9.3.5 Future Directions

Suggest meaningful next steps:

Future research should examine whether these effects persist over longer retention intervals and whether caffeine benefits different types of memory (e.g., procedural, episodic). Additionally, investigating dose-response relationships and individual differences in caffeine metabolism would help optimise practical applications.

9.3.6 Conclusion

End with a brief take-home message:

In conclusion, this study provides evidence that moderate caffeine consumption enhances short-term verbal memory. These findings have practical implications for students and professionals seeking to optimise cognitive performance.

10 References

10.1 General Principles

- New page with "References" centred and bold at top
- Double-spaced throughout
- Hanging indent (first line flush left, subsequent lines indented 1.27 cm)
- Alphabetical order by first author's surname

- Include DOI or URL where available

10.2 Common Reference Formats

10.2.1 Journal Article

Author, A. A., & Author, B. B. (Year). Title of article. *Title of Periodical*, volume(issue), page–page. <https://doi.org/xxxxx>

Example:

Smith, J. R., & Jones, K. L. (2018). Caffeine and cognitive performance: A meta-analysis. *Psychopharmacology*, 235(4), 415-428. <https://doi.org/10.1007/s00213-017-4789-0>

10.2.2 Book

Author, A. A. (Year). *Title of work: Capital letter also for subtitle*. Publisher.

Example:

Baddeley, A. D. (2012). *Working memory: Theories, models, and controversies*. Oxford University Press.

10.2.3 Edited Book Chapter

Author, A. A. (Year). Title of chapter. In E. E. Editor (Ed.), *Title of book* (pp. xx–xx). Publisher.

Example:

Cowan, N. (2014). Working memory underpins cognitive development. In P. Bauer & R. Fivush (Eds.), *The Wiley handbook on the development of children's memory* (pp. 202-231). Wiley.

10.2.4 Webpage

Author, A. A. (Year, Month Day). *Title of page*. Site Name. URL

Example:

British Psychological Society. (2021, June 15). *Code of ethics and conduct*.
<https://www.bps.org.uk/guideline/code-ethics-and-conduct>

10.3 In-Text Citations

10.3.1 One Author

- Smith (2020) found that...
- ... was demonstrated (Smith, 2020).

10.3.2 Two Authors

- Smith and Jones (2020) argued that...
- ... has been reported (Smith & Jones, 2020).

10.3.3 Three or More Authors

- Smith et al. (2020) demonstrated...
- ... as previously shown (Smith et al., 2020).

10.3.4 Multiple Citations

List alphabetically, separated by semicolons:

- Several studies support this finding (Brown, 2019; Smith, 2020; Taylor & Jones, 2018).

10.3.5 Direct Quotes

Include page number:

- Smith (2020) stated that “caffeine significantly improves attention” (p. 42).
- It has been argued that “caffeine significantly improves attention” (Smith, 2020, p. 42).

11 Appendices

11.1 When to Use Appendices

Include supplementary material that is:

- Too detailed for the main text
- Important for replication
- Useful for interested readers

Examples:

- Full questionnaires or scales
- Complete word lists
- Detailed instructions given to participants
- Additional statistical analyses

11.2 Formatting Appendices

- Start each appendix on a new page
- Label as Appendix A, Appendix B, etc.
- Give each a descriptive title
- Refer to appendices in the main text: “The full word list is provided in Appendix A”

12 Common Mistakes to Avoid

12.1 Formatting Errors

Error	Correction
Single spacing	Use double spacing throughout
Inconsistent font	Use one font throughout
Missing page numbers	Number all pages from title page
Incorrect heading levels	Follow APA hierarchy
References not hanging	Indent all lines after first

12.2 Writing Errors

Error	Correction
"Proved" the hypothesis	Use "supported" (science doesn't prove)
"Insignificant" results	Use "non-significant"
Personal pronouns in results	Prefer passive voice in Results
Interpreting results in Results section	Save interpretation for Discussion
Stating "no relationship" when non-significant	Say "no significant relationship was found"

12.3 Statistical Reporting Errors

Error	Correction
$p = .000$	Write $p < .001$
Forgetting df	Always include degrees of freedom
Inconsistent decimal places	M and SD to 2 places; p to 3 places
Missing effect size	Include d, r, or other appropriate measure
Not explaining abbreviations	Define on first use

13 Quick Reference Checklist

13.1 Before Submitting

13.1.1 Formatting

- ☐ 12pt Times New Roman (or equivalent)
- ☐ Double-spaced throughout
- ☐ 2.54cm margins
- ☐ Page numbers top right
- ☐ Paragraphs indented

13.1.2 Title Page

- ☐ Informative title
- ☐ Your name and institution

- ☐ Module details

13.1.3 Abstract

- ☐ 150-250 words
- ☐ No paragraph indent
- ☐ Covers aim, method, results, conclusion

13.1.4 Introduction

- ☐ Funnels from broad to specific
- ☐ Relevant literature reviewed
- ☐ Clear rationale for study
- ☐ Hypothesis stated at end

13.1.5 Method

- ☐ Design: IV, DV, design type
- ☐ Participants: N, demographics, recruitment
- ☐ Materials: All items described
- ☐ Procedure: Step-by-step with timings

13.1.6 Results

- ☐ Descriptive statistics reported
- ☐ Inferential test results in correct format
- ☐ Effect size included
- ☐ Tables/figures labelled correctly

13.1.7 Discussion

- ☐ Findings summarised
- ☐ Results interpreted and linked to literature
- ☐ Limitations acknowledged
- ☐ Future directions suggested
- ☐ Conclusion provided

13.1.8 References

- ☐ All citations have references
- ☐ All references are cited
- ☐ Correct format for each type
- ☐ Alphabetical order
- ☐ Hanging indent
